Marginal placentation

Axile placentation

Parietal placentation

Free central placentation

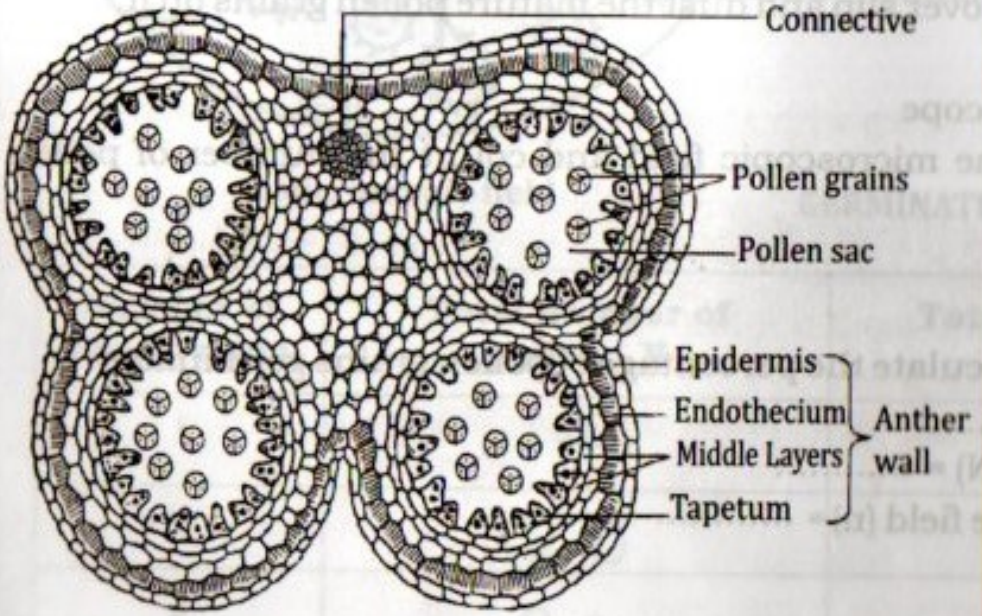

Basal placentation

T.S. OF OVARY SHOWING PLACENTATION

T.S of Anther to observe number of layers

T.S. of anther shows the following parts

- **Epidermis :** outer protective layer
- **Endothecium** hypodermal layer helps in dehiscence
- **Middle layers :** 2-3 parenchymatous layers-protective in function
- **Tapetum :** Inner nourishing layer
- **Pollen Sac :** a sac with pollen grains

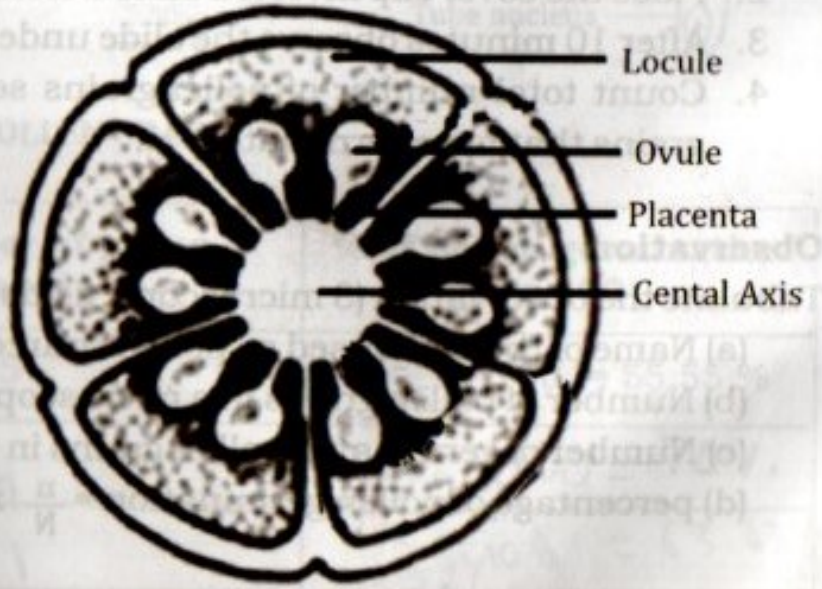

T.S. OF ANTHER

Prepare a temporary slide of given material **"A"**by taking a transverse section of ovary and report the number of locules and type of placentation.

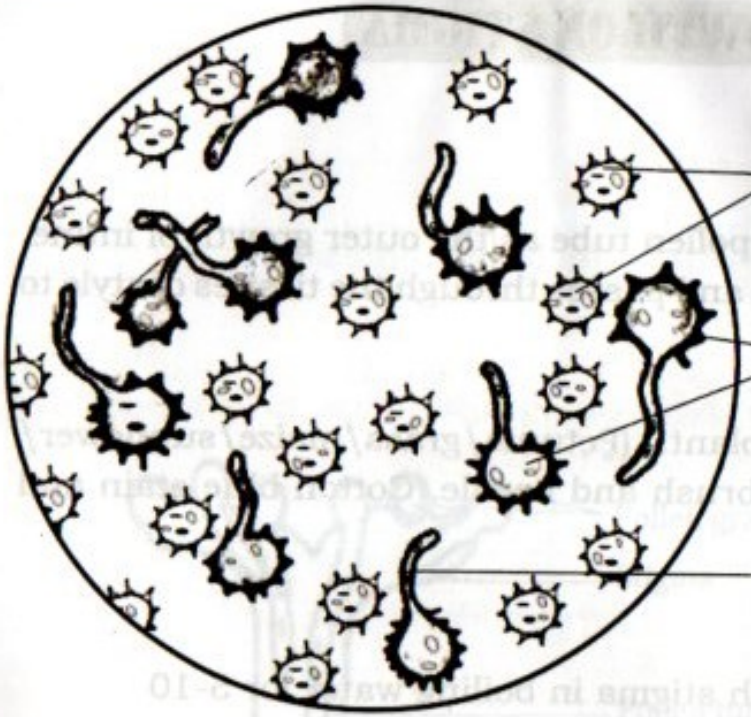

Cut T.S. of ovary, mount it on a slide and observe

a. Number of locules in the ovary
b. Type of placentation

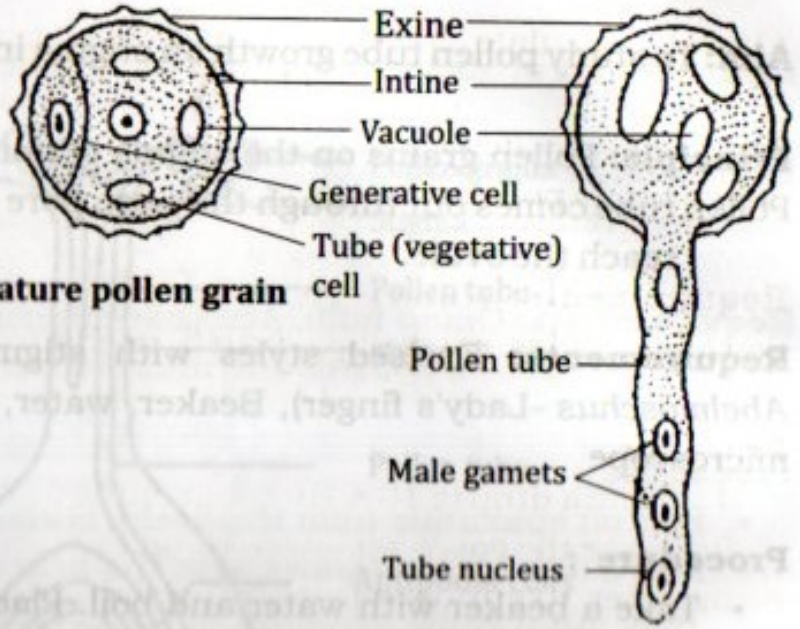

a. In hibiscus there are five locules **(Pentalocular)**
b. The type of placentation is **axile**

T.S. OF HIBISCUS OVARY

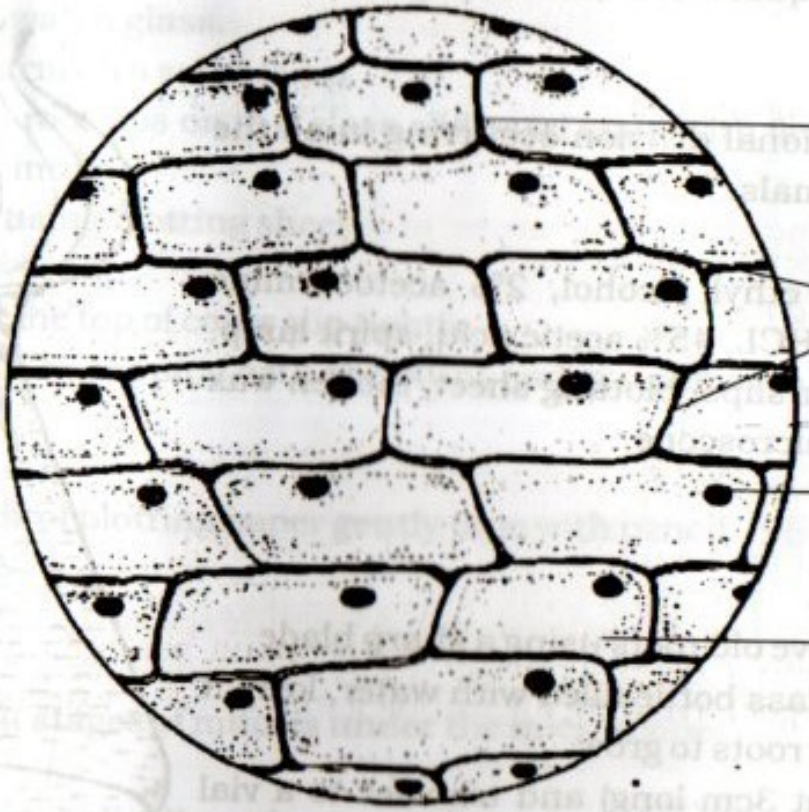

Microscopic field

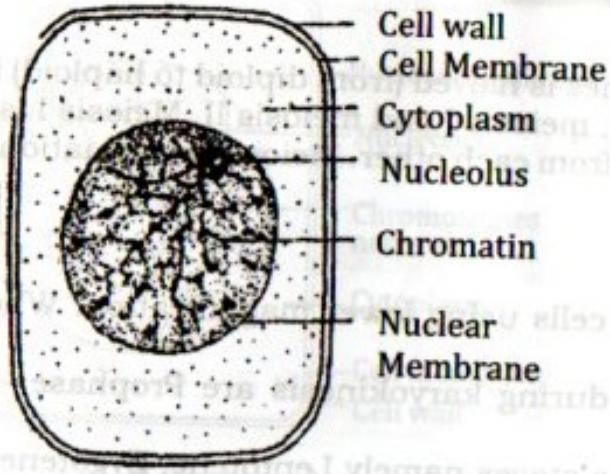

Mature pollen grain

GERMINATION OF POLLEN GRAINS

Number of observation	Total number of pollen - N	Total number of pollen germinated - n	% of pollen germination $\frac{n}{N}$ x 100
1	45	25	$\frac{25}{45}$ x 100 = 55.55 %
2	20	14	$\frac{14}{20} \times 100 = 70\%$
3	38	31	$\frac{38}{31} \times 100 = 63.63\%$
Average	46	31	$\frac{46}{31} \times 100 = 67.39\%$
